

Century Group Delivers Spill Containment Pans for Railroad Locomotive Fueling Platform

Helping railroads meet their environmental goals and objectives is a challenge this day in time with the constant changes in environmental regulations. It is Century Group's goal to be a team player with Class I and Shortline railroads across North America by supplying state-of-the-art quality steel railroad spill containment pans to meet their specific project needs.

Century Group Inc. partnered with Coleman Industrial Supply headquartered in Kansas City, Missouri by providing galvanized metal spill containment pans for a locomotive fueling facility in Aberdeen, South Dakota. The metal spill pans featured a gasketed open cross drain system with an HDPE flashing abutting the rail to insure that the metal collection pans would not interfere with the BNSF's signal system.

The metal spill pans were also delivered with a heavy non-skid textured coating that featured a safety yellow color on the perimeter walls for increased awareness to railroad personnel working within the confines of the locomotive fueling rack.

Century Group's Rob Greenside commented, "It was a privilege to work with Coleman Industrial Supply on this project. The galvanized spill collection pans furnished by our company on this project play an integral part in BNSF railroads goal of being good stewards of the environment."

For more information on Century Groups Inc.'s state-of-the-art railroad spill containment pans email the Century Group Railroad Products Division or call 1-800-527-5232, Ext. 118.
